

The γ result is width-invariant; the one exception is the split *within* the two non-utility channels (lag 12, task 0, module A)

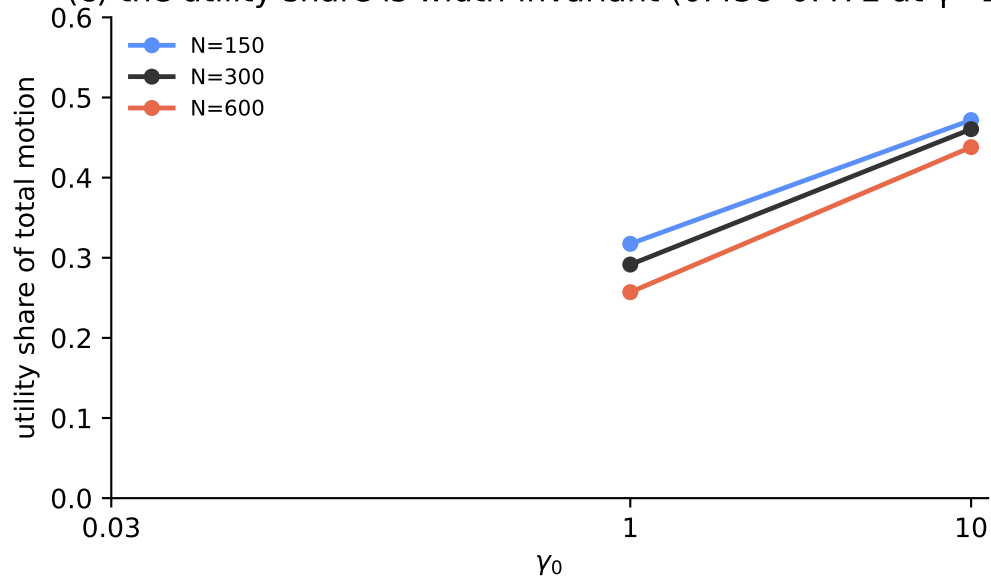

(a) how much is lost — 1.3% spread at $\gamma=10$

(b) which channel carries it, per width

(c) the utility share is width-invariant (0.438-0.472 at $\gamma=10$)

(d) the exception: the radius/dimension split moves ($\gamma=10$)
